

## **Technical reviews for permit applications**

Applications, renewals and amendments for some types of permits under the Environment Act require the submission of specialized technical information in conjunction with the permit application (see table below).

When a technical review is required for an application, the Environmental Programs Branch (EPB) will notify the applicant in writing. The notification will include details such as the standardized cost and timeline of the review. Standard costs and timelines ensures that the review process is fair and transparent for applicants. The cost structure separates some reports into "average" and "complex" categories, where "complex" reports are associated with a higher cost and longer timeline to review.

Technical reviews are completed by experts on a list of qualified technical expert reviewers established by the Government of Yukon. These reviewers can be called upon to assess technical information submitted in conjunction with permit applications.

If the applicant chooses not to proceed with the permit application or the applicant does not pay the review cost within 60 days of being notified that a review is required, EPB will not issue a new, renewed or amended permit

If the applicant wishes to proceed, they will be required to pay the cost of the technical review to EPB. These funds are then used in their entirety to contract an approved external technical expert to review the information. The review must be completed and the information deemed adequate prior to issuing, renewing or amending the permit.

In some cases, after reviewing the technical information, the reviewer may recommend that changes be made. If significant changes are recommended, EPB will notify the permit applicant of the required modifications and the additional cost and length of time to have those modifications reviewed. If the applicant does not provide the modified technical information and pay the additional required review cost within 90 days of being notified of the required changes, EPB will not issue the permit.

## Reviews for large or complex projects

The technical documents listed in the <u>table below</u> are externally reviewed at the cost of the permit applicant. Other types of technical information may require an external review if the technical information is associated with a large or complex project and must be assessed by a technical expert prior to the activity being permitted.

Report type and permit type	Description	Cost	Timeline (days)
Air emissions data for	Source or ambient air quality data collected from more than 10 sites/sources	\$7,400	28
air emissions permit	around a permitted activity.		
Air dispersion model	Air dispersion models use a variety of parameters to predict the concentration of air pollutants originating from a		
for air emissions	specific industrial or commercial activity. Proponents are responsible for preparing and submitting an air dispersion		
permit	model prior to being issued a permit for a large or significant project that has the potential to negatively impact the surrounding air quality.		
	Average: Screening dispersion model, as defined by the US EPA or BC Ministry of Environment.	\$4,200	21
	Complex: Advanced or non-screening dispersion model, as defined by the US EPA or BC Ministry of Environment.	\$6,400	28
Hydrogeological	A hydrogeological assessment evaluates the hydrogeological conditions of a site and involves the installation of		
assessment for land	groundwater monitoring wells. Hydrogeological assessments are required by persons applying to construct or operate		
treatment facility	a land treatment facility that accepts special wastes or has a capacity of 3000 m³ or greater. Hydrogeological		
permit or solid waste	assessments are also required for all class 1 and class 2 landfills and some modified transfer stations.		
disposal facility	Average: Less than ten groundwater monitoring wells installed <b>and</b> none of the	\$4,200	21
permit	groundwater monitoring wells are screened in bedrock.		
	Complex: Ten or more groundwater monitoring wells are installed <b>or</b> one or more	\$8,500	28
	of the groundwater monitoring wells are screened in bedrock.		
Site assessment for	A site assessment aims to assess the type and amount of contaminants present at	\$4,200	21
risk-based restoration	a contaminated site and the spatial extent of contamination. Site assessments will		
permit and Ministerial	be externally reviewed when a person applies to conduct risk-based restoration of		
authorizations	a contaminated site or applies for a ministerial authorization for a contaminated		
	site.		
Screening-level risk	A risk assessment aims to determine the level of risk posed to receptors (e.g.,	\$3,200	14
assessment for risk-	people) by the contamination observed at a contaminated site. Risk assessments		
based restoration	are required for persons applying to conduct risk-based restoration of a		
permit	contaminated site.		
Comprehensive risk	A risk assessment aims to determine the level of risk posed to receptors (e.g.,	\$9,500	28
assessment for risk-	people) by the contamination observed at a contaminated site. Risk assessments		
based restoration	are required for persons applying to conduct risk-based restoration of a		
permit	contaminated site.
